- 1024 by 1024 1:1 Image Format
- Image Area 13.3 x 13.3 mm
- Back Illuminated Format
- Frame Transfer Operation
- 13 μm Square Pixels
- Symmetrical Anti-static Gate Protection
- Very Low Noise Output Amplifiers
- Gated Dump Drain on Output Register
- 100% Active Area
- Advanced Inverted Mode Operation (AIMO)

APPLICATIONS

- Spectroscopy
- Scientific Imaging
- Star Tracking
- Medical Imaging

INTRODUCTION

This version of the CCD47 family of sensors has full-frame architecture. Back illumination technology, in combination with extremely low noise amplifiers, makes the device well suited to the most demanding scientific applications. To improve the sensitivity further, the CCD is manufactured without anti-blooming structures.

This device has a single serial output register. Separate charge detection circuits are incorporated at each end of the register, which is split so that a line of charge can be transferred to either output, or split between the two.

The register is provided with a drain and control gate along the outer edge of the channel for charge dump purposes.

The sensor is made using Marconi Applied Technologies' Advanced Inverted Mode process to minimise dark current, allowing the device to be operated with extended integration periods and minimal cooling.

Other variants of the CCD47-20 available are front illuminated format and non-inverted mode. In common with all Marconi Applied Technologies CCD Sensors, the CCD47-20 is also available with a fibre-optic window or taper, or with a phosphor coating.

Designers are advised to consult Marconi Applied Technologies should they be considering using CCD sensors in abnormal environments or if they require customised packaging.

TYPICAL PERFORMANCE

Maximum readout frequency	5	MHz
Output responsivity	4.5	$\mu\text{V}/\text{e}^-$
Peak signal	100	ke^-/pixel
Dynamic range (at 20 kHz)	~50 000:1	
Spectral range	200 - 1100	nm
Readout noise (at 20 kHz)	2.0	$\text{e}^- \text{ rms}$

NOTES

- Signal level at which resolution begins to degrade.
- Measured between 253 and 293 K and V_{SS} +9.5 V. Dark signal at any temperature T (kelvin) may be estimated from:

$$Q_d/Q_{d0} = 1.14 \times 10^6 T^3 e^{-9080/T}$$
 where Q_{d0} is the dark signal at T = 293 K (20 °C).
- Test carried out at Marconi Applied Technologies on all sensors.
- Dynamic range is the ratio of full-well capacity to readout noise measured at 253 K and 20 kHz readout speed.
- CCD characterisation measurements made using charge generated by X-ray photons of known energy.
- Measured using a dual-slope integrator technique (i.e. correlated double sampling) with a 20 μs integration period.
- Readout at speeds in excess of 5 MHz into a 15 pF load can be achieved but performance to the parameters given cannot be guaranteed.
- Measured between 253 and 293 K, excluding white defects.

BLEMISH SPECIFICATION

Traps Pixels where charge is temporarily held. Traps are counted if they have a capacity greater than 200 e⁻ at 253 K.

Slipped columns Are counted if they have an amplitude greater than 200 e⁻.

Black spots Are counted when they have a signal level of less than 80% of the local mean at a signal level of approximately half full-well.

White spots Are counted when they have a generation rate 125 times the specified maximum dark signal generation rate (measured between 253 and 293 K). The typical temperature dependence of white spot defects is different from that of the average dark signal and is given by:

$$Q_d/Q_{d0} = 122T^3e^{-6400/T}$$

White column A column which contains at least 21 white defects.

Black column A column which contains at least 21 black defects.

GRADE	0	1	2
Column defects:			
black or slipped	0	2	6
white	0	0	2
Black spots	50	100	200
Traps > 200 e ⁻	2	5	12
White spots	50	80	100

Grade 5 Devices which are fully functioning, with image quality below that of grade 2, and which may not meet all other performance parameters.

Note The effect of temperature on defects is that traps will be observed less at higher temperatures but more may appear below 253 K. The amplitude of white spots and columns will decrease rapidly with temperature.

Maximum voltages between pairs of pins:

pin 10 (OSL) to pin 11 (ODL) ±15 V

pin 22 (ODR) to pin 23 (OSR) ±15 V

Maximum output transistor current 10 mA

NOTES

- Readout register clock pulse low levels +1 V; other clock low levels 0 ± 0.5 V.
- Drain not incorporated, but bias is still necessary.
- 3 to 5 V below OD. Connect to ground using a 2 to 5 mA current source or appropriate load resistor (typically 5 to 10 kΩ).
- Non-charge dumping level shown. For operation in charge dumping mode, DG should be pulsed to 12 ± 2 V.
- All devices will operate at the typical values given. However, some adjustment within the minimum to maximum range may be required to optimise performance for critical applications. It should be noted that conditions for optimum performance may differ from device to device.
- With the RØ connections shown, the device will operate through the right-hand output only. In order to operate from both outputs RØ1(L) and RØ2(L) should be reversed.

ORDERING INFORMATION

Options include:

- Temporary Quartz Window
- Permanent Quartz Window
- Temporary Glass Window
- Permanent Glass Window
- Fibre-optic Coupling
- UV Coating
- X-ray Phosphor Coating

For further information on the performance of these and other options, please contact Marconi Applied Technologies.

HANDLING CCD SENSORS

CCD sensors, in common with most high performance MOS IC devices, are static sensitive. In certain cases a discharge of static electricity may destroy or irreversibly degrade the device. Accordingly, full antistatic handling precautions should be taken whenever using a CCD sensor or module. These include:-

- Working at a fully grounded workbench
- Operator wearing a grounded wrist strap
- All receiving socket pins to be positively grounded
- Unattended CCDs should not be left out of their conducting foam or socket.

Evidence of incorrect handling will invalidate the warranty. All devices are provided with internal protection circuits to the gate electrodes (pins 3, 4, 5, 7, 13, 14, 15, 16, 17, 18, 19, 20, 26, 28, 29, 30, 31) but not to the other pins.

HIGH ENERGY RADIATION

Device parameters may begin to change if subject to an ionising dose of greater than 10⁴ rads.

Certain characterisation data are held at Marconi Applied Technologies. Users planning to use CCDs in a high radiation environment are advised to contact Marconi Applied Technologies.

TEMPERATURE LIMITS

	Min	Typical	Max	
Storage	73	-	373	K
Operating	73	273	323	K

Operation or storage in humid conditions may give rise to ice on the sensor surface on cooling, causing irreversible damage.

Maximum device heating/cooling 5 K/min
