

**Measurements of WHT M1 as a check, after sustained calima and reported rain. No cleaning.**  
**Taken by Neil O'Mahony using SMS micro-Scan reflectometer, through M1 portholes**  
**Measuring high due to high ambient temperatures (20deg). Last CO2 cleaning was on 3 July.**  
**Successive measurements with similar scattering measurements are in same location**  
**%R exceeding specification repeatability of 0.5% are marked "skip" & omitted from average**  
**Ref are measurements of MG reference mirror, typically 91-93% using SMS**

Measurements on Reference mirror immediately afterwards. Up to 1.5% higher than usual.

This implies that M1 measurements may be up to 1.5% overestimated.

If this higher reading were due to temperature it would imply a 10 degree difference wr.t. July 3

Only about 5 degrees increase can be accounted for, leading to overestimation of about 0.5% R

Scattering and roughness at levels prior to last cleaning.

Decrease in R% significant only if we assume it is overestimated by >0.9%, which seems unlikely.
