

February 2017 Water Wash of INT Primary mirror - Reflectivity data from CT7 and SMS reflectometers

Washing carried out by Lucia Suarez, Taoran Li (INT student SAs) and Neil O'Mahony. Measurements by Emilie Lhome and Neil.

Conclusions: Wash successfully restored reflectivity to within almost 2% of the levels of fresh aluminium.

Scattering was slightly lower than on the WHT M1 after water wash. Reflectivity was less than 0.5% different.

Comparison with results from previous washes:

WHT M1 2015/08	3.85E-03	7.52E-04	0.848	58.0
WHT M1 2014/10	3.38E-03	5.32E-04	0.854	54.9
INT M1 2014/09	1.17E-03	2.44E-04	0.856	28.2
INT M1 2013/12	1.87E-03	3.15E-04	0.857	37.5

Conclusion: Scattering and roughness is consistent with previous values, in between levels of INT and WHT.

Reflectivity is 2% lower, contradicting conclusion from CT7 (but using older results for comparison).

Reference mirror check

The reference mirror reflectivity is above 93%, which means there is no evidence of dirt contamination of the head

The reference scattering measurements are lower than usual, particularly at 50,180 deg.
