

Results from first CO2 cleaning of WHT Primary mirror after its aluminisation, following 25 nights on sky for optical tests during Standdown.

Aluminisation was on 3 April, followed immediately by WEAVE Standdown and Covid-19 confinement.

Calima occurred with dust concentration 20-60 ug/m<sup>3</sup> (TNG meter) during AGBP test on nights of 2, 3 and 5th July and again 6,7,8th.

This means mirror was exposed to 3 nights (typically 6 hrs each) of significant dust levels before each of the measurement series shown below.

Temp. °C		wavelength of band (nm)							"Dust Indices"

Conclusion: CO2 has recovered ~2/3 of Reflectivity lost since Aluminising. M1 remains 0.5% lower in %R and ~0.5% in Scattering, but only in red.

CO2 has recovered about 1%R, a little more of the average reflectivity loss due to the 3 nights of calima immediately before cleaning (0.5%)

Hence it has not only removed the dust accumulated recently, but also part of that accumulated in the previous months.

Calima caused loss of reflectivity ~ 0.8% in all wavebands in each of two periods of exposure at ~50 ug/m3 (TNG) of about 3 nights long.

Calima also caused increase in scattering ~ 1%, rising to 1.5% towards red wavebands.

As usual, the reflectivity measurements are much more variable after cleaning than before, showing the patchy non-uniform results of CO2.
